

Test Cases

1. **Security:** The user will be prompted to login to the application. To show that this works properly, the application will let the user use its features after entering in the correct login credentials.
2. **Generate temporary sessions using code:** To show that there are different sessions, the user should be able to generate a random code and enter that session, as well as exit the previous session and create a new random code for a new session. They also will not be able to alter any information or data in any other session if they are not in that session.
3. **Queuing music in a priority queue:** When the user hits the like/dislike button, they should be able to see that particular song go up or down in the queue, based off of other users' votes as well.
