The two application features we included were in the front end mockup of our web app, this included a near complete user interface that allows the user to:

- Create a new account
- Log into the application
- Generate a host code
- Host a music queue
- Kick members of a current queue
- Join an existing queue
- Log out from the application

All of these features were covered in the demo with the TA. The TA was very pleased with our front end design- we were also able to show our backend framework using Django. This showed our instances for user sessions and their unique token keys- that are generated each time a user creates a private session. Max was able to show the admin dashboard in the backend to display all of the features Django has to offer- this will be extremely helpful in the development of the web app.

Lots of progress has been made on the back end and this was acknowledged by the TA, he suggested that we start work on the front end. We are pleased to say that front end development has started today (3/29) and we are planning to finish all front end material by next meeting. Once we finish the front end material we will be able to start integration which will get us prepared for finalizing the project.
